

**ABSTRACT**

Method for the removal of particulate matter from aqueous suspension comprising steps of  
5 establishing value of pH and of Zeta potential of particles in the suspension;  
providing a porous filter having a membrane layer consisting of at least a metal-oxide with a Zeta potential at the pH value of the suspension having same polarity of the Zeta potential as the particles in the suspension;  
10 passing the suspension through the porous filter; and withdrawing a filtrate.
